Improving Health Outcomes Through
Reliable Data Sharing and Integration

Connecting Providers and Systems

Providers want to prescribe responsibly to their patients but need complete information to do so. RxCheck is a solution to share prescription data securely across state lines and to seamlessly integrate prescription data into electronic medical records.

State-Led Control and Development

RxCheck was designed with the involvement of state Prescription Drug Monitoring Program (PDMP) administrators, private industry, and the federal government. RxCheck is governed by participating states that prioritize enhancements and development.

Simple and Cost-Effective Solution

RxCheck does not charge subscription, user, or transaction fees. Technical support for implementation, integration, and maintenance is available at no cost to the states through federal assistance.

End-to-End Security and Auditing

The RxCheck system infrastructure has been tested and validated and includes the latest design improvements to meet the needs of the state PDMPs. Data security and audit trail capabilities satisfy the most stringent requirements.
